406. Queue Reconstruction by Height

Medium[5136](#)[540](#)[Add to List](#)[Share](#)

You are given an array of people, `people`, which are the attributes of some people in a queue (not necessarily in order). Each `people[i] = [hi, ki]` represents the i^{th} person of height h_i with **exactly** k_i other people in front who have height greater than or equal to h_i .

Reconstruct and return the queue that is represented by the input array `people`. The returned queue should be formatted as an array `queue`, where `queue[j] = [hj, kj]` is the attributes of the j^{th} person in the queue (where j is the person at the front of the queue).

Example 1:

Input: `people = [[7,0],[4,4],[7,1],[5,0],[6,1],[5,2]]`

Output: `[[5,0],[7,0],[5,2],[6,1],[4,4],[7,1]]`

Explanation:

Person 0 has height 5 with no other people taller or the same height in front.

Person 1 has height 7 with no other people taller or the same height in front.

Person 2 has height 5 with two persons taller or the same height in front, which are person 0 and person 1.

Person 3 has height 6 with one person taller or the same height in front, which is person 1.

Person 4 has height 4 with four people taller or the same height in front, which are people 0, 1, 2, and 3.

Person 5 has height 7 with one person taller or the same height in front, which is person 1.

Hence `[[5,0],[7,0],[5,2],[6,1],[4,4],[7,1]]` is the reconstructed queue.

Example 2:

Input: `people = [[6,0],[5,0],[4,0],[3,2],[2,2],[1,4]]`

Output: `[[4,0],[5,0],[2,2],[3,2],[1,4],[6,0]]`

Constraints:

- $1 \leq \text{people.length} \leq 2000$
- $0 \leq h_i \leq 10^6$
- $0 \leq k_i < \text{people.length}$
- It is guaranteed that the queue can be reconstructed.
