An integer is a **palindrome** when it reads the same backward as forward.

- For example, 121 is a palindrome while 123 is not.

### Example 1:

**Input:** x = 121

**Output:** true

**Explanation:** 121 reads as 121 from left to right and from right to left.

### Example 2:

**Input:** x = -121

**Output:** false

**Explanation:** From left to right, it reads -121. From right to left, it becomes 121-. Therefore it is not a palindrome.

### Example 3:

**Input:** x = 10

**Output:** false

**Explanation:** Reads 01 from right to left. Therefore it is not a palindrome.

### Constraints:

- $-2^{31} \leq x \leq 2^{31} - 1$

**Follow up:** Could you solve it without converting the integer to a string?
